Mobility Hub research for Municipality of Utrecht

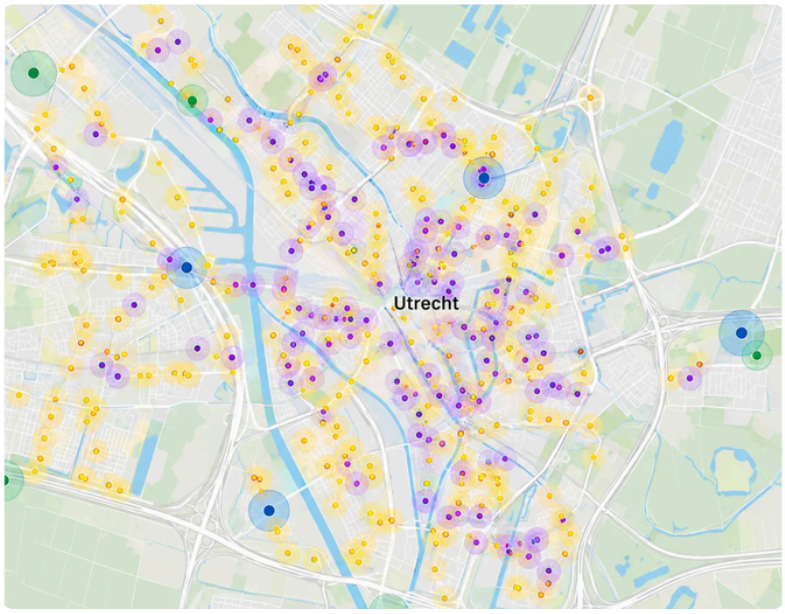

2021

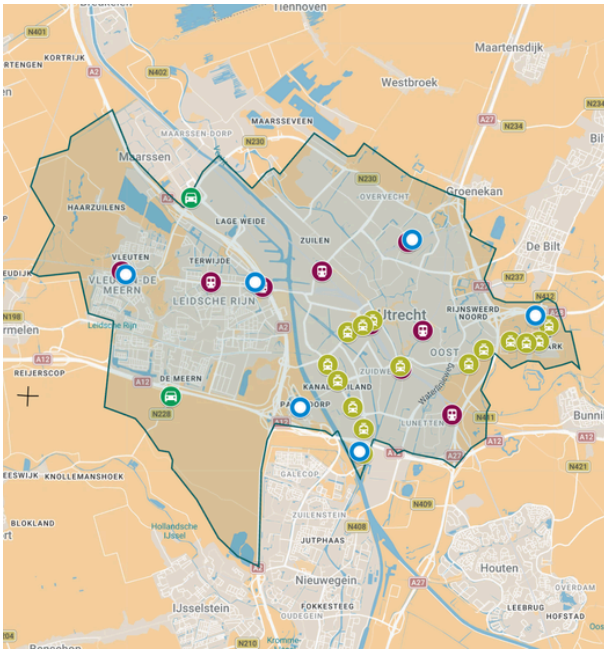

Collaboration with **Advier** & **SVP**

For the Municipality of Utrecht, I designed and carried out a spatial research method to identify suitable locations for pilot mobility hubs.

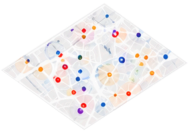

Using Google Maps and hand-drawn maps, the research focused on public transport connections, walking distances, and opportunities to connect different modes of transport. The method was developed as a clear, step-by-step process, making the analysis transparent and easy for the municipality to follow.

By combining these findings with additional spatial and accessibility criteria, the team selected three promising locations for pilot mobility hubs. The results contributed to a broader advisory **report** for the municipality

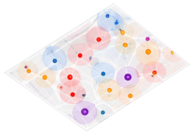

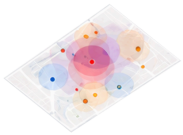

1. **Map the mobility network** Train stations, busstops, tram stops and P+R locations

2. **Add a walking radius** Create a ~ 100m walking radius around each location

3. **Identify overlaps** Areas where multiple networks come together indicate higher potential for a mobilty hub

4. **Shortlist locations** The strongest overlap areas are assessed pn additional criteria, sich as available space, neighbourhood contect, bicycle infrastructure an roas accesibility
